

- Rishel

Maths is everywhere - wherever you lay your eyes
maths is there. You may not realise it but every
step you take maths is following you. For example
baking a cake involves maths. Measuring ingredients,
calculating the cooking time and the ratio of
ingredients they are all maths.

Many people like maths, including myself
however there are portions of people that don't.
They don't, because they do not 'notice' maths
in everyday life. I believe the school system
greatly contributes towards this issue. Students
The system creates a confusion on what maths
really is. Students believe that maths is just a
subject they are obliged to study. ~~and~~ They
are forced to take tests on 'Pythagoras' theorem'
and feel good if they get decent grade ~~and~~ hate
life if they fail. ~~Both of~~ What is common between
these two kinds of students is, they do not
know what it is ~~for~~ and they do not know
why they are doing it.

~~The~~ If the system changes, the students
will change with it. Until then, ~~see~~ people who
like maths ~~stay~~ will remain happy thinking they
understand maths. As for the rest, they will
stay wondering why maths exist and they
will never find an answer to the question.
